Human enhancement: Genetic engineering and evolution
Human germline engineering is the process by which the genome of an individual is edited in such a way that the change is heritable. This is achieved through genetic alterations within the germ cells, or the reproductive cells, such as the egg and sperm. Human germline engineering is a type of genetic modification that directly manipulates the genome using molecular engineering techniques.

Human germline engineering - Wikipedia

Genetic engineering can hamper the genetic diversity in humans if all the defective genes were replaced by functional genes. In such a scenario, all humans will have a similar genetic makeup, and therefore, a new and unknown virus or a disease may affect a much larger population of humans.

Human Genetic Engineering History goes back to the 1919 when an engineer from Hungary gave a term biotechnology to products developed by using raw materials. The engineer made use of this term in its best possible sense. Civilizations in the ancient times discovered that a lot of products can be made by using micro-organisms.
