A mean-variance analysis is a tool that investors use to help spread risk in their portfolio. In it the investor measures an asset's risk, expressed as the "variance," then compares that with the asset's likely return. The goal of mean-variance optimization is to maximize an investment's reward based on its risk.

Mean-Variance Portfolio Optimization Diversification It works because the expected return on a portfolio is the weighted-average of the expected returns of the assets in the portfolio, but the standard deviation of the portfolio is less than the weighted average of the individual standard deviations of the assets in the portfolio.

The mean-variance portfolio optimization problem is formulated as: $\min w^T \Sigma w$ subject to $w^T \mu = p$ and $w^T \mathbf{1} = 1$: Note that the specific value of p will depend on the risk aversion of the investor. This is a simple quadratic optimization problem and it can be solved via standard Lagrange multiplier methods.

Modern Portfolio Theory, or also known as mean-variance analysis is a mathematical process which allows the user to maximize returns for a given risk level. It was formulated by H. Markowitz and while it is not the only optimization technique known, it is the most widely used.

Modern portfolio theory, or mean-variance analysis, is a mathematical framework for assembling a portfolio of assets such that the expected return is maximized for a given level of risk. It is a formalization and extension of diversification in investing, the idea that owning different kinds of financial assets is less risky

Portfolio optimization is the process of selecting the best portfolio (asset distribution), out of the set of all portfolios being considered, according to some objective. The objective typically maximizes factors such as expected return, and minimizes costs like financial risk. Factors being considered may range from tangible (such as assets, liabilities, earnings or other fundamentals) to ...

Mean Variance Optimization (MVO), also known as Modern Portfolio Theory (MPT), is a quantitative asset allocation technique that allows you to use diversification to balance the risk and return in your portfolio. We currently offer two mean variance optimizers: VisualMvo (single-period) and MvoPlus (multi-period with rebalancing).
