chosen by members of the National Cotton Council, Agronomy and Physiology Conference and held at the Beltwide Cotton Conferences. Prominent speakers will be invited to partake in the symposium, and together with additional invited authorities, will make up the subsequent book. The first of the new small book physiology of cotton series is on “Stress Physiology”. The next symposium, to be held at the Beltwide Cotton Conferences in Atlanta in January 2011, and

Stress Physiology in Cotton - The National Cotton Council

ton. Experiments with potted plants have shown stomatal closure due to water stress in cotton to be similar to other crops. Kanemasu and Tanner (1969) and Boyer (1970) quantified stomatal resistance on a variety of crops, including cotton, and found that stomatal resistance due to sto-matal closure increased dramatically at between -0.8 and -1.2 MPa.

vided by the National Cotton Council and offices are in the Council's building in Memphis, Tennessee. The Foundation is pleased to initiate a program to publish a series of cotton reference books with this volume, COTTON PHYSIOLOGY, being the first. Second and third books in the series, WEEDS OF COTTON: Characterization

Cotton Physiology

Such a wide spectrum of stress and phytohormone responsiveness suggests that GhJAZ genes may play important regulatory roles in stress tolerance in cotton. The cis -element analysis revealed that various hormone-responsive cis -elements appear on most of the GhJAZ genes promoters, suggesting that the GhJAZ proteins may respond to multiple phytohormone signals (Supplementary Table S7).

JASMONATE ZIM-Domain Gene Family Mediates JA Signaling and ...

As the season progresses maximum T s (>35 °C, heat stress) are commonplace throughout cotton production regions and may adversely affect growth and development thus affecting water use, yield and fibre quality (Hodges et al., 1993).

Cotton crop phenology in a new temperature regime ...

Sorghum (Sorghum bicolor (L.) Moench) and cotton (Gossypium hirsutum L.) are the summer crops traditionally grown in the rainfed or supplementary irrigated areas of the semi-arid southern Great Plains. Both crops have the ability to withstand periods of water deficit and to yield an economic return to the farmer. Numerous traits contribute to drought tolerance in both sorghum and cotton.
